

June 15-21, 2000

The Terra team successfully conducted a 12-second drag make-up maneuver on June 20th. The Terra mission successfully conducted a series of three MODIS instrument calibration rolls on June 21st.

The ASTER Instrument team will begin full operations on June 22nd. They have resolved enough of the time jump problems to begin full production. This is a significant increase in the volume of data that will test the EOS Data and Operations System (EDOS) and the Solid State Recorder management team.

The Solid State Recorder command anomaly that occurred after last week's CERES yaw maneuvers has been isolated to a spacecraft procedure error. This was due to a telemetry timing problem after a system recycle.

Terra Plans:

The Flight Operations Team will continue to support MISR, MODIS, and ASTER scientific field campaigns. Also, the Ops Team will continue performing trending and data analysis in support of the slowly increasing temperature of the MODIS focal plane..

Terra Issues and Concerns:

None.
